Excellent article by @chriscmooney on the new AIRS satellite temperature analysis from @ClimateOfGavin and colleagues, featuring thoughts from @ed_hawkins and myself:

UAH is a ridiculous outlier. Their calculations do not agree with the vast bulk of data from real thermometers, towers, aircraft, balloons, and satellites. They have repeatedly been forced to apologize for their errors, and will again and again in the future. DON'T BE CONNED!

For what it's worth RSS (the other MSU record) shows more warming in the lower troposphere than NASA GISTEMP does at the surface. Lots of structural uncertainty in the MSU data.

Looks pretty similar in slope since 1975, perhaps difference is due to baseline differences?

Slightly more is still more. But yes, the difference is fairly small:

2 1 2

John Mitchell @RisetoClimate · Apr 17

As we shift to a more prevalent +IPO (more often El Ninos) due to cloud feedbacks and aerosol emissions reductions in China the difference will become greater.

Scott, in this context, UAH is not even an outlier, let alone a ridiculous one. drroyspencer.com/2019/04/uah-rs...

Scott Denning @airscottdenning · Apr 23

Here are published UAH estimates of warming rates. Real observations show a rate of around 0.15 to 0.20 C/decade. So if the UAH model actually could agree on a number, it's improved by fixing so many errors over the years. But UAH uncertainty doesn't rule out anything! 0? 0.4?
